                                                                                                                    The present invention describes an isolated, purified nucleic acid, which is an altered CD40 ligand (CD40L) promoter (I) for CD40 ligand, having residues 331-455 of the sequence comprising 455 nucleotides given in AAF74905 where A in the wild type sequence at position 331 (corresponding to position -125) is replaced with C. (I) has antiarthritic, and can be used in gene therapy. (I) is useful in the study, diagnosis and treatment of inflammatory and autoimmune diseases, as well as diseases in which elevated expression of CD40L is a factor, e.g., rheumatoid arthritis. The present sequence represents a CD40L poly-A tract sequence which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   arthritis. For beta 2 gene amplification, primers 8319 and 8720 (AAQ93199-200) were used; primers Betatoxi and BetatoxR (AAQ93201-02) were used for the beta 1 gene. The 3 B strains examined possessed the beta 1 gene. Type C strains had either
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 29
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enterotoxin;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of a bovine microsatellite sequence obtd. by coreening a library of bovine MboI DNA fragments of between 250 and 500 cc by with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 cc clones cross-hybridised. Assuming independent distribution of cc in the bovine genome is estimated at 110, 000. The sequence information cc for ca. 230 such bovine microsatellites is summarised in the cc specification and indexed herein (see below). The sequences upstream and cc downstream of the microsatellite sequence were used to generate the crequired PCR primers for in vitro amplification of the corresp. cc microsatellite (using the program opTIPRIM). The microsatellites may be used to identify individuals, for parentage testing, and in the genetic cc mapping of economic trait loci, or genes involved the determinism of ce comomically important traits esp. in cattle, to allow selective consecutive. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN cc field.)

                                                                                                                                                                                                                                                                                                                                                                                                The synthetic oligomer is capable of forming a triplex at physiological CC pH with a purine rich target sequence by coupling into the major groove co of the duplex. The specific target sequence of this oligomer is an HIV c target duplex contg. a purine-rich region concentrated on one chain of the duplex. The oligomer, and others like it are useful in diagnosis and ctherapy of diseases characterised by specific DNA duplex targets, e.g. CHV, hepatitis, herpes, malignant tumours and inflammation. The triple chalices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. Additional modifications, such as altered inter- nucleotide linkages may also be incorporated, rendering the oligomer e.g. stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-C 2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is an HIV target duplex contg a purine-rich region concentrated on one chain of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HIV, hepatitis, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. Additional modifications, such as altered inter- nucleotide linkages may also be incorporated, rendering the oligomer e.g. stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18-JAN-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAQ79182-Q79186 contain one or more 9-methyl-acyclo-adenosines, acylic nucleoside analogues which inhibit nuclease degradation. The nuclease resistant oligonucleotides can themselves be used to inhibit gene expression as antisense agents, in nucleic acid sequencing and diagnost assays. (Updated on 25-MAR-2003 to correct PN field.)

The nuclease resistant oligonucleotides can themselves be used to inhibit gene expression as antisense agents, in nucleic acid sequencing and diagnostic assays. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                             The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the mucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in pattents with rheumatoid arthritis, asthma and other inflammatory disorders.                                                               The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. The conjugates form triple-helix complexes with DNA of higher stability compared with corresponding oligonuclectides, due to the intercalation of the aglycone moiety in the DNA target. They can be used against activated oncogenes in the treatment of tumours and against the proviral genome of retroviruses. (Updated on 25-MAR-2003 to correct PR field.)                                                                                                            This sequence represents a specifically claimed example of a conjugate which consists of a natural or modified oilgonucleotide capable of forming a triple-helix complex with a double stranded DNA, linked, via an appropriate linker, to the aglycone-moiety of an anthracycline or to an anthracyclinene. The conjugates form triple-helix complexes with DNA of higher stability compared with corresponding oilgonucleotides, due to the intercalation of the aglycone moiety in the DNA target. They can be used against activated oncogenes in the treatment of tumours and against the proviral genome of retroviruses. (Updated on 25-MAR-2003 to correct PR field.) RESULT 2687
                                                                                                                                                                                                                       A new method is provided for the synthesis of oligonucleotides having N3'
->P5' phosphoramidate linkages. The method comprises (a) attaching a 3'-
protected amino nucleoside to a solid support; (b) deprotecting the 3'-
amino; (c) reacting with a 3'-protected aminonucleoside-5'-
phosphoramidite monomer to form an internucleoside N3'->P5'
phosphoramidite link; (d) oxidising this link to phosphoramidate; and
coptionally repeating steps (b)-(d) until the required oligonucleotide is
completed. This method provides better yields with lower reagent
consumption than known processes, and can be operated on a large scale.
The obtained oligos, containing phosphoramidate linkages, have favourable
binding properties, nuclease resistance and solubility, and are useful as
research, diagnostic and therapeutic agents. The present sequence is an
example of an oligonucleotide in which N3'->P5' phosphoramidate linkages
have been introduced by the new method. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                                                                                       A new method is provided for the synthesis of oligonucleotides having N3'->+P5' phosphoramidate linkages. The method comprises (a) attaching a 3'-protected amino nucleoside to a solid support; (b) deprotecting the 3'-amino; (c) reacting with a 3'-protected aminonucleoside-5'-phosphoramidite monomer to form an internucleoside N3'-> P5' phosphoramidite link; (d) oxidising this link to phosphoramidate; and optionally repeating steps (b)-(d) until the required oligonucleotide is completed. This method provides better yields with lower reagent
                 AAV07431;
                                                                                                                                                                                                                                                                                consumption than known processes, and can be operated on a large scale. The obtained oligos, containing phosphoramidate linkages, have favourable binding properties, nuclease resistance and solubility, and are useful as research, diagnostic and therapeutic agents. The present sequence is an example of an oligonucleotide in which N3'->P5' phosphoramidate linkages have been introduced by the new method. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthesis of N3' to P5' phosphoramidate oligo:nucleotide - by reac immobilised 3'-amino nucleotide with new amino:nucleoside 5'-phosphoramidite then oxidation, useful as research, diagnostic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide containing phosphoramidate linkages

These comprise a reactive group, a release group and a non-volatile mass label comprising a synthetic polymer or biopolymer CC detectable by mass spectrometry. The RTCs can be used as probes for the CC detection of TMs. They can be used for e.g. identification of gene CC sequences, identification of non-coding nucleotide sequences, detection of mutations within a gene or protein sequence, detection of metals, detection of toxins, detection of receptors on an organism or CC of metals, detections and characterisation of niteractions, enzymence substrate interactions and characterisation of ligand interactions. Multiplex applications include multiple pathogen diagnostics, multigene CC substrate interactions include multiple pathogen diagnostics, multigene CC genetic polymorphism screening, single nucleotide polymorphism (SNP) CC genotyping, clone and gene mapping, and gene expression analysis. The CR permit the ready detection of releasable mass labels by mass spectroscopy. The releasable mass labels permit the multiplexing of tens, hundreds and perhaps even thousands of different mass labels that can be considered to uniquely identify each desired target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC This sequence represents an oligonucleotide receptor molecule covalently CC bound to a polyacrylamide gel via a linking group. The invention relates to selective separation of electrically charged target molecules in an CC analytical mixture. It comprises capillary affinity gel electrophoresis CC using a capillary tube which is at least partly filled with a polymer CC gel. Receptors for target molecules are covalently bound to the polymer. CC An electric field of at least 50 volts/cm is applied. The capillary tube is charged with the analytical mixture. In a first separation stage, the CC is charged with the analytical mixture are bound to the receptors and the remaining components are eluted, optionally whilst splitting open. In a second stage, the elution conditions are changed, optionally in stages, co that the affinity of the traget molecules for the receptor is that the affinity of the traget molecules for the receptor is californiated and the target molecules are eluted and detected, optionally whilst splitting open. The process is useful for selective separation CC and/or determination of charged organic compounds, such as a for carbohydrares. It may be used a c for carbohydrares.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Best Local Similarity Matches 15; Conserv

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          oligonucleotides, peptides or carbohydrates. It may be used, e.g. for isolation of specific proteins and DNA molecules, purification of antibodies, analysis of antisense compounds or screening for enzyme inhibitors. The process achieves higher resolution and selectivity than prior art processes, especially in the case of complex biological analytical mixtures. It has high sensitivity, even with small amounts of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC process using capillary affinity gel electrophoresis. The invention CC process using capillary affinity gel electrophoresis. The invention CC crelates to selective separation of electrically charged target molecules CC in an analytical mixture. It comprises capillary affinity gel control of the capillary tube is charged with the analytical mixture. In a first CC separation stage, the target molecules in the mixture are bound to the capillary tube is charged molecules in the mixture are bound to the control of the capillary open. In a second stage, the elution conditions are changed, coptionally in stages, so that the affinity of the target molecules for the receptor is eliminated and the target molecules are eluted and control of c

                                                                                                                                                                                                                                                                                                                                                                         This sequence represents an example of an oligonucleotide containing novel 3'-amino-5'-phosphoramidite nucleoside of the invention. The sequence is generated synthetically by using an amine-exchange reaction of phosphoramidites in which a deprotected 3'-amino group of an oligonucleotide chain is exchanged for the amino portion of a 5'-phosphoramidite with a protected 3' amino group. The resulting phosphoramidite internucleotide linkage is oxidised to form a stable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Key

The sequence is generated synthetically by using an amine-exchange reaction of phosphoramidites in which a deprotected 3'-amino group of an oligonucleotide chain is exchanged for the amino portion of a 5'-phosphoramidite with a protected 3' amino group. The resulting phosphoramidite internucleotide linkage is oxidised to form a stable protected phosphoramidate linkage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  21-FEB-1996;

                                                                                                                                 The present sequence represents PCR primer used to amplify cDNA encoding a mouse cystatin-related protein, designated testatin. The protein is capable of inducing testis formation in foetal gonads. It is highly probable that the protein inhibits testis tumour growth because of structural and functional similarities with tumour inhibiting cystatins. The cystatin-related protein testatin may be useful for inducing testis formation in foetal gonads. Testatin polymucleotides are useful as a source of primers and probes, which can be used to detect the presence of testatin nucleic acid molecules in a sample. The testatin polymucleotides, polypeptides, and compositions can be used for treating genital tumours and may also be useful for creating a model for studying testic marting and may also be useful for creating a model for studying

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence in the 3' non-core region. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 15 BP; 0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                    New DNA encoding endo-beta-mannanase from coffee, used e.g. in pharmaceutical, cosmetic or food compositions to hydrolyze polymannans.
                                                                                                                         Marraccini P,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mannanase enzyme, which is involved in the hydrolysis of polysaccharides that consist of molecules of mannan, either simple or branched, linked together by beta (1-4) bonds. The mannanase polynucleotide sequence is used for in vivo modification of the coffee endo-beta-mannanase gene. It is also used to produce transgenic plant cells (especially coffee cells) which have modified properties of mannan polysaccharide, and thus altered flavour or structure. The enzyme is used for modification, degradation or synthesis of mannan polysaccharides in vitro, particularly to treat coffee beans to increase the percentage of dry matter extraction, and thus reduce the quantity of sediment
The present primer was used to reverse transcribe human RNA, from which a CDNA sequence encoding a protein with heparanase catalytic activity was amplified. The heparanase (hpa) polynucleotide is useful in gene therapy, particularly in treating tumour, inflammation or autoimmunity. Particularly, the polynucleotide is useful in modulating the bioavailability of heparin-binding growth factors, cellular responses to heparin-binding growth factors (e.g. bFGF) and cytokines (e.g. interleukin (IL)-8), cell interaction with plasma lipoproteins, cellular susceptibility to certain viral and some bacterial and protozoa infections, or disintegration of neurodegenerative plaques. The polynucleotide is also useful in wound healing (e.g. thermal, chemical or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; heparanase; gene therapy; tumour; inflammation; autoimmunit heparin-binding growth factor; cytokine; neurodegenerative plaque; wound healing; infection; burn; angiogenesis; restenosis; atherosclerosis; inflammation; neurodegenerative disease; gerstmann-Straussler Syndrome; Creutzfeldt-Jakob disease; primer;

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as componers in oligomers, which are used in pharmaceutical compositions to consider in the composition of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-ci infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in compositions or compositions and such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or conclecules, receptor molecules, oytokines, oncogenes, growth factors and conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair conglesses, triplexes or other forms of stable association. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     និន្តិនិង
     The invention provides modified nucleomonomers of specified formula and CC their pharmaceutically acceptable salte. The nucleomonomers are used as CC monomers in oligomers, which are used in pharmaceutical compositions to CC inhibit expression of nucleic acid molecules including DNA and RNA in CC ells such as bacterial, fungal, yeast, mammalian, cancer and virally-CC infected cells. They are used in oligomers for gene regulation, antisense CC technology, diagnostic applications to detect target sequences in CC included RNAs that encode enzymes, bormones, serum proteins, adhesion CC molecules, receptor molecules, cytokines, oncogenes, growth factors and CC interleukins associated with pathological conditions, cardiovascular disorders, immune reactions, cancer, viral CC conditions and bacterial infections (see AAA07786 for details of other CC uses for which the oligomers are suitable for). Oligomers comprising the CC target nucleic acid sequences, are physiologically when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and CC fidelity for target DNA sequences, are physiologically stable, non-toxic and CC single-or double-stranded target nucleic acid binding activity to form CC AAA07786-803 represent oligonucleotides forming a third strand along with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                 Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleomonomer; cancer; gene regulation; antisense technology; leukemia; viral infection; inflammatory response; cellular proliferation; psoriasis; duplex; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       S X
                                                                                                                                                                                                                                          their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antiser technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
                                                                                 conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant
                                 single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAAO7820-834 represent sequences forming triplex oligomers
                                                                                                                                                                                                       molecules, receptor molecules, cytokines, oncogenes, growth factors and interleakins associated with pathological conditions such as inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                         The invention provides modified nucleomonomers of specified formula and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   02-MAR-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WO200011013-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleomonomer; cancer; gene regulation; antisense technology; leukemia; viral infection; inflammatory response; cellular proliferation; psoriasis; duplex; triplex; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAA07828 standard; DNA; 15 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                          their pharmaceutically acceptable salts. The nucleomonners are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions.
                                                                                                   conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers ere suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAA07788-803 represent oligonucleotides forming a third strand along with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modified nucleomonomers, used in physiologically stable, non-
oligomers used to inhibit expression of nucleic acids and in
regulation, antisense technology and diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 2000-246530/21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              psoriasis, duplex; ss.

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as compositions to compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-compositions to detect target sequences in childing DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-compositions to detect target sequences in cological samples such as those containing pathogenic bacteria, funging biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones, serum proteins, adhesion cellecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions, cardiovascular disorders, immune reactions, cancer, viral conditions, cardiovascular disorders, immune reactions, cancer, viral conditions and bacterial infections (see AAA07786 for details of other cuses for which the oligomers are suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target mucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant cubecase, triplexes or other forms of stable association. Sequences the duplex parameters.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              psoriasis; duplex; ss.

                                                                                                                                                                                                                           conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers are suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAA07788-803 represent oligonucleotides forming a third strand along with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions associated with pathological conditions such as inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAA07795 standard; DNA; 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 their pharmaceutically acceptable salts. The nucleomonomers are used monomers in oligomers, which are used in pharmaceutical compositions monomers in oligomers, which are used in pharmaceutical compositions inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules including DNA and RNA inhibit expression of nucleic acid molecules acid molec
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention provides modified nucleomonomers of specified formula their pharmaceutically acceptable salts. The nucleomonomers are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; Page 20; 42pp; English.

CC their pharmace processor of the components are used as C monomers in oligomers, which are used in pharmaceutical compositions to cinhibit expression of nucleic acid molecules including DNA and RNA in CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-clinifected cells. They are used in oligomers for gene regulation, antisense crechnology, diagnostic applications to detect target sequences in the biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or cencoded RNAs that encode enzymes, hormones, serum proteins, adhesion condecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral confictions, cardiovascular disorders, cancer, viral c

                                                                                                                                                                                          The invention provides modified nucleomonomers of specified formula and CC their pharmaceutically acceptable salts. The nucleomonomers are used as CC monomers in oligomers, which are used in pharmaceutical compositions to CC inhibit expression of nucleic acid molecules including DNA and RNA in CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-cc infected cells. They are used in oligomers for gene regulation, antisense CC technology, diagnostic applications to detect target sequences in CC biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion CC interleukins associated with pathological conditions such as inflammatory CC conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other cuses for which the oligomers are suitable for). Oligomers comprising the CC nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair C fidelity for target DNA sequences. The oligomers demonstrate significant customers, triplexes or other forms of stable association. Sequences or the properson oligomucleotides forming a third strand along with

The nucleomonomers are used as components in oligomers, which are used in pharmaceutical compositions to cinhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-cc infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in cological samples such as those containing pathogenic bacteria, funging biological samples such as those containing pathogenic bacteria, funging conditions, receptor molecules, cytokines, oncogenes, to target genes or considered RNAs that encode enzymes, hormones, serum proteins, adhesion concerned RNAs that encode enzymes, hormones, serum proteins, adhesion contextions, cardiovascular disorders, immune reactions, cancer, viral conditions, cardiovascular disorders, immune reactions, cancer, viral conditions and bacterial infections (see AAA07786 for details of other cuses for which the oligomers are suitable for). Oligomers comprising the concile mucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair conditions, triplexes or other forms of stable association. Sequences can be the process of the forms of stable association. Sequences or the form of stable association. Sequences or the form of stable forming a third strand along with the conditions of the condit

                                                                                                                                                                                                                                                                                                 The invention provides modified nucleomonomers of specified formula and CC their pharmaceutically acceptable salts. The nucleomonomers are used as CC monomers in oligomers, which are used in pharmaceutical compositions to CC enlis such as bacterial, fungal, yeast, mammalian, cancer and virally-CC infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in CC biological samples such as those containing pathogenic bacteria, fungi CC and viruses, oncogenes, growth hormones and enzymes, to target genes or CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion CC infectules, receptor molecules, cytokines, oncogenes, growth factors and CC interleukins associated with pathological conditions such as inflammatory CC conditions, cardiovascular disorders, immune reactions, cancer, viral CC infections and bacterial infections (see AAA07786 for details of other cuses for which the oligomers are suitable for). Oligomers comprising the CC custified the conditions of the conditions of the cuses for which the oligomers are suitable for) and subject or details of other CC target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair CC daplexes, triplexes or other forms of stable association. Sequences CC AAA07820.814 represent sequences are represented to the conditions of the conditions of

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in the concentration of the containing pathogenic bacteria, fungicand viruses, oncogenes, growth hormones, serum proteins, adhesion molecules, receptor molecules, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and conterleukins associated with pathological conditions such as inflammatory conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAAO7786 for details of other nucleic acid sequences, are physiologically stable, non-toxic and the pathological conditions associated with pathological conditions cancer, viral suses for which the oligomers are suitable for). Oligomers comprising the nucleic acid sequences, are physiologically stable, non-toxic and the pathological conditions and bacterial infections are physiologically stable, non-toxic and the pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gold
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                23-JUN-2000

The invention provides modified nucleomonomers of specified formula and their pharmaceutically acceptable salts. The nucleomonomers are used as CC monomers in oligomers, which are used in pharmaceutical compositions to CC inhibit expression of nucleix acid molecules including DNA and RNA in CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-CC infected cells. They are used in oligomers for gene regulation, antisense tethnology, diagnostic applications to detect target sequences in CC diological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion CC interleukins associated with pathological conditions, cardiovascular disorders, immune reactions, cancer, viral CC conditions and bacterial infections (see AAA07786 for details of other CC uses for which the oligomers are suitable for). Oligomers comprising the CC nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and collected, triplexes or other forms of stable association. Sequences cancer, triplexes or other forms of stable association. Sequences or the forms of stable association. Sequences with the duplex of an appresent oligomucleotides forming a third strand along with the content of the content of the stable association.

their pharmaceutically acceptable salts. The nucleomonomers are used as commonmers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-cinfected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in conjugated samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or cencoded RNAs that encode enzymes, hormones, serum proteins, adhesion conjugated RNAs that encode enzymes, hormones, serum proteins, adhesion conjugated conditions, cardiovascular disorders, immune reactions, cancer, viral conditions, cardiovascular disorders, immune reactions, cancer, viral conditions, cardiovascular disorders, immune reactions, cancer, viral consistent nucleic acid sequences are suitable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant conjugates, triplexes or other forms of stable association. Sequences and conjugates, triplexes or other forms of stable association. Sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC their pharmaceutically acceptable salts. The nucleonomers are used as CC monomers in oligomers, which are used in pharmaceutical compositions to CC inhibit expression of nucleic acid molecules including DNA and RNA in CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-CC infected cells. They are used in oligomers for gene regulation, antisense CC technology, diagnostic applications to detect target sequences in CC biological samples such as those containing pathogenic bacteria, fungi CC and viruses, oncogenes, growth hormones and enzymes, to target genes or CC molecules, receptor molecules, cytokines, oncogenes, growth factors and CC interleukins associated with pathological conditions such as inflammatory CC conditions, cardiovascular disorders, immune reactions, cancer, viral CC infections and bacterial infections (see AAAO7786 for details of other CC uses for which the oligomers are suitable for). Oligomers comprising the nucleonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and components are into cells while maintaining stringent base pair
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
CC infected cells. They are used in oligomers for gene regulation, antisense
CC technology, diagnostic applications to detect target sequences in
CC biological samples such as those containing pathogenic bacteria, fungi
CC and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC interleukins associated with pathological conditions such as inflammatory
CC conditions, cardiovascular disorders, immune reactions, cancer, viral
CC infections and bacterial infections (see AAA07786 for details of other
CC uses for which the oligomers are suitable for). Oligomers comprising the
CC uncleomonomers exhibit increased duplex DNA stability when hybridizing to
CC target nucleic acid sequences, are physiologically stable, non-toxic and
CC fidelity for target DNA sequences. The oligomers demonstrate significant
CC fidelity for target DNA sequences. The oligomers demonstrate significant
CC fidelity for percent oligomers or other forms of stable association. Sequences
CC AAA07788-803 represent oligonucleotides forming a third strand along with

Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences handown the duplex acrossors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                their pharmaceutically acceptable salts. The nucleomonomers are used as monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisens technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 15 BP; 0 A; 0 C; 0 G; 0 T; 15 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            02-MAR-2000

conditions, cardiovascular disorders, immune reactions, cancer, viral infections and bacterial infections (see AAA07786 for details of other uses for which the oligomers resultable for). Oligomers comprising the nucleomonomers exhibit increased duplex DNA stability when hybridizing to target nucleic acid sequences, are physiologically stable, non-toxic and able to penetrate into cells while maintaining stringent base pair fidelity for target DNA sequences. The oligomers demonstrate significant single- or double-stranded target nucleic acid binding activity to form duplexes, triplexes or other forms of stable association. Sequences AAA07788-803 represent oligonucleotides forming a third strand along with
                                                                                                                                                                                                                                                                                                                   cells such as bacterial, fungal, yeast, mammalian, cancer and virally-infected cells. They are used in oligomers for gene regulation, antisense technology, diagnostic applications to detect target sequences in biological samples such as those containing pathogenic bacteria, fungi and viruses, oncogenes, growth hormones and enzymes, to target genes or encoded RNAs that encode enzymes, hormones, serum proteins, adhesion molecules, receptor molecules, cytokines, oncogenes, growth factors and interleukins associated with pathological conditions such as inflammatory conditions associated with pathological conditions such as inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               their pharmaceutically acceptable salts. The nucleomonomers are used a monomers in oligomers, which are used in pharmaceutical compositions to inhibit expression of nucleic acid molecules including DNA and RNA in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modified nucleomonomers, used in physiologically stable, non-toxic oligomers used to inhibit expression of nucleic acids and in gene regulation, antisense technology and diagnostics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
Cl infected cells. They are used in oligomers for gene regulation, antisense
CC technology, diagnostic applications to detect target sequences in
CC biological samples such as those containing pathogenic bacteria, fungi
CC and viruses, oncogenes, growth hormones and enzymes, to target genes or
CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
CC molecules, receptor molecules, cytokines, oncogenes, growth factors and
CC interleukins associated with pathological conditions such as inflammatory
CC conditions, cardiovascular disorders, immune reactions, cancer, viral
CC uses for which the oligomers are suitable for). Oligomers comprising the
CC uses for which the oligomers are suitable for) conditions non-toxic and
CC able to penetrate into cells while maintaining stringent base pair
CC fidelity for target DNA sequences. The oligomers demonstrate significant
CC single- or double-stranded target nucleic acid binding activity to form
CC duplexes, triplexes or other forms of stable association. Sequences
CC AAA07788-803 represent oligonucleotides forming a third strand along with

cc cells such as bacterial, fungal, yeast, mammalian, cancer and virally-
cl infected cells. They are used in oligomers for gene regulation, antisense
ct technology, diagnostic applications to detect target sequences in
cc biological samples such as those containing pathogenic bacteria, fungi
cc and viruses, oncogenes, growth hormones and enzymes, to target genes or
cc encoded RNAs that encode enzymes, hormones, serum proteins, adhesion
cc molecules, receptor molecules, cytokines, oncogenes, growth factors and
cc interleukins associated with pathological conditions such as inflammatory
cc conditions, cardiovascular disorders, immune reactions, cancer, viral
cc infections and bacterial infections (see AAA07786 for details of other
cuses for which the oligomers are suitable for). Oligomers comprising to
cuses for which the oligomers are suitable for) conditions, cancer,
cc nucleomonomers exhibit increased duplex DNA stability when hybridizing to
carget nucleic acid sequences, are physiologically stable, non-toxic and
cc able to penetrate into cells while maintaining stringent base pair
cf iddelity for target DNA sequences. The oligomers demonstrate significant
cc single- or double-stranded target nucleic acid binding activity to form
duplexes, triplexes or other forms of stable association. Sequences

AAA07788-803 represent oligonucleotides forming a third strand along with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         their pharmaceutically acceptable salts. The nucleomonomers are used monomers in oligomers, which are used in pharmaceutical compositions inhibit expression of nucleic acid molecules including MA and RNA ir cells such as bacterial, fungal, yeast, mammalian, cancer and virally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 20; 42pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention provides modified nucleomonomers of specified formula and CC their pharmaceutically acceptable salts: The nucleomonomers are used as CC monomers in oligomers, which are used in pharmaceutical compositions to CC inhibit expression of nucleic acid molecules including DNA and RNA in CC cells such as bacterial, fungal, yeast, mammalian, cancer and virally-CC infected cells. They are used in oligomers for gene regulation, antisense CC technology, diagnostic applications to detect target sequences in CC biological samples such as those containing pathogenic bacteria, funging and viruses, oncogenes, growth hormones and enzymes, to target genes or CC encoded RNAs that encode enzymes, hormones, serum proteins, adhesion CC interleukins associated with pathological conditions such as inflammatory CC conditions, cardiovascular disorders, immune reactions, cancer, viral CC infections and bacterial infections (see AAAO7786 for details of other CC nucleomonomers exhibit increased duplex DNA stability when hybridizing to CC target nucleic acid sequences, are physiologically stable, non-toxic and CC infections into cells while maintaining stringent base pair CC fidelity for target DNA sequences. The oligomers demonstrate significant CC single- or double-stranded target nucleic acid binding activity to form CC AAAO7788-803 represent oligonucleotides forming a third strand along with the CC stranger of the complexes or other forms of stable association. Sequences the duplex sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides. Oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological stability. The conformationally-modified oligonucleotides may be useful as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New conformationally restricted 3',5'-bridged nucleosides and oligonucleotides useful as antisense therapeutics or as gene-specific

All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides. Oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological stability. The conformationally-modified oligonucleotides may be useful as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                      the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides. Oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological stability. The conformationally-modified oligonucleotides may be useful as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics

                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to hybridisation probes which target a specific sequence within a large double-helical nucleic acid. The probe is complementary to the target sequence and contains at least one nucleotide with an attached molecule that is able to cleave double-helical DNA e.g. EDTA-Re(II) (ethylenediaminetetrascetic acid-iron complex). The probes where the attached molecule is a label or compound that alters gene expression, are used for specific detection and/or cleavege of double-helical DNA, e.g. for diagnosis, for treatment of disease (particularly caused by viruses, genetic defects or oncogenes), for chromosomal analysis, and for the isolation and mapping of genes. The present sequence represents probe of the invention used in an example illustrating how the probe binds to and cleaves double stranded DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New hybridization probe for specific triplex formation with large double helices, useful e.g. for site-specific diagnostic cleavage, contains attached functional residue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is that of the oligonucleotide (ODN) component of an CC ODN-MGB (minor groove binder)-LF (latent fluorophore) conjugate of the CC invention. MGBs bind in a non-intercalating manner to the minor groove of CC invention. MGBs bind in a non-intercalating manner to the minor groove of CC non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly but in an intercalating manner, or lies in the minor groove, or is CC oriented in some other way to the DNA molecule by MGB, such that it concerns fluorescent (or its fluorescent properties change detectably). The conjugates are used as hybridisation probes and amplification primers CC for fluorescent detection of specifically hybridising sequences, for canalysis or diagnosis, especially (real-time) PCR, for single-nucleotide mismatch discrimation, target or signal amplification, array-based CC analysis or diagnosis, especially (real-time) PCR, for single-nucleotide mismatch discrimation, target or signal amplification, array-based CC triplex formation. Many different targets can be detected a single conjugate was used to demonstrate CC complementary targets equence there was an increase in fluorescence cC complementary target sequence there was an increase in fluorescence cC complementary target sequence there was an increase in fluorescence cC complementary target sequence there was an increase in fluorescence cC the hybrid between the ODN-MGB-LF conjugate and its target sequence to the fluorescence emitted by the hybrid cff and its target sequence to the confidence contents of the fluorescence emitted by the hybrid cff and its target sequence to the confidence contents of the fluorescence emitted by the hybrid cff and its target sequence to the confidence contents of the fluorescence emitted by the hybrid cff and its target sequence to the confidence contents of the confidence 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hydrolysed cross-linked vinyl acetate copolymer carrier material loaded C with nucleotide derivative(s). The product is an intermediate for the large (gram) scale solid phase synthesis of modified oligonucleotides CC useful e.g. as clinical diagnostics and therapeutics, e.g. for the creatment of AIDS and cancers. The presence of the partially hydrolysed CC copolymer facilitates the synthesis of larger amounts of oligonucleotides CC compared with the use of Merckogel (RTM, macroporous polyvinyl acetate) CC oligonucleotides are obtained in very good quality and high yields, Also, CC Oligonucleotides do not display the reduced activity seen in some prior CC art procedures, less carrier material, reagents and solvent are required. CC Obviates expansion or contraction during use or solvents, which CC obviates expansion or contraction during use or solvent exchange. CC AAH20510-AAH20513 represent oligonucleotides containing modified deoxynucleotides which are used to illustrate the method of the invention CC deoxynucleotides which are used to illustrate the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                               Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; kelo skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasi IGF binding protein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris growth factor mediated cell proliferation; ichthyosis; serborrhoea; rukeratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic diseas hyperneovascular condition; hyperplasia; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for ameliorating the effects skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Pactor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (MURD-) MURDOCH CHILDRENS RES

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           c skin disorders. The method comprises contacting the skin with an cantisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an coligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood coesses is a condition of the retina, cancers of the growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood conditions are conditionally the condition of the skin, and the condition of the skin cancers of the growth factor-mediated malignancies, other sclerotic conditions of the skin cancers of the growth factor-mediated malignancies, other sclerotic conditions of the skin cancers of the growth factor-mediated malignancies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

The coding sequences for this protein contain single nucleotide polymorphisms (SNPs) which may be associated with differences in susceptibility to atopy, inflammatory and immune diseases and different drug responses. They may also be used in applications such as forensic and paternity testing and studying population diversity and anthropological lineage. The IL4 gene is found on human chromosome 5q31.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                  Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
```

This invention describes novel polyamide-oligonucleotide derivatives (I) and their physiologically acceptable salts of formula $F(\{DNA\}-Li\}$ g(PNA-Li) g(PNA-Li) g(PNA) g(PNA)

Example

Page 40;

54pp; German.

New DNA-peptide nucleic acid chimeras, useful e.g. as antisense agents $\dot{}$ for treating e.g. cancer, also as diagnostic probes and primers.

the invention have anticancer, antiproliferative, antiviral, hepatotropic compression by antisense, ribozyme, sense, or triple-helix methods, or by binding to proteins (aptamers). (I) are used for the inhibition of gene companies of the proteins (aptamers). (I) are used for treating diseases caused by viruses (human immune deficiency, herpes simplex, influenza, vesicular storativis, hepatitis B or papilloma), or mediated by integrins or cell-cell adhesion reactions, for treating cancer, or for inhibiting crestenosis, particularly as antisense reagents. They are also useful in the heterogeneous or homogeneous assays, as primers or probes, particularly where the target is amplified before being detected by hybridization, for the increased affinity for complementary strands and better stability in the increased affinity for complementary strands and better stability in the increased affinity for complementary strands and better stability in the increased affinity conventional peptide nucleic acids (PNA), but lack the disadvantages, i.e. have improved cellular uptake, do not aggregate in aqueous solution, and have reduced affinity for purification complements, reduced cytotoxicity, better sequence specificity. They are more active than either DNA or PNA oligomers. When used as probes, (I) show different responses to base-pair mismatches in the DNA and PNA segments, allowing better discrimination between pathogenic and nongenetary better sequence specificaty. They are concepted to eliminate RNA or DNA primers. The DNA component allows to be used to eliminate RNA or DNA primers. The DNA component allows of additional reactions not possible with NA H49208-AAH49208 control of the proporated into a gene. AAH49208-AAH49208 control of the proporated into a gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   secreted proteins in heterologous expression systems. The encoded polypeptides can be used to prevent tumour anglogenesis, metastasis and invasion, and to intervene with pathologies associated with impaired heparin-binding growth factors, cellular responses to heparin-binding growth factors and cytokines, cell interaction with plasma lipoproteins, cellular susceptibility to viral, protozoa and bacterial infections or disintegration of neurodegenerative plaques. The present sequence represents a chicken heparanase (hpa) cDNA cloning oligo dT(15) primer
          separation of nucleic acid molecules and as probes, primers, linkers adapters and antisense agents on solid supports. Modifications enhan their use as capture and detection probes e.g. by the incorporation biotin, digoxigenen, radioisotopes, fluorescent labels such as fluorescein and reporter molecules such as alkaline phosphatase. The also used for enhancing or inhibiting the activity of an enzyme or cellular activity. The compounds are stable to nucleases and proteas
                                                                                                                                           This invention relates to oligonucleotide analogues comprising
